README

Rhythm Medium-Fi Prototype

InVision link: https://invis.io/SA97HRLXD#/202541530_Sign_In_Page

General Use Notes

- The user may sign in through Facebook or e-mail, or Sign Up if they haven't already made an account
- They are taken to the sign up details page (they wouldn't be taken to this page if it wasn't their first time singing in). Facebook auto-fills some information (like name and gender) already - the rest is filled in by the user (talents, genres/styles, etc)
- They are then taken to a camera page where they must upload a video or select a video from the camera roll. This serves as their performance video that will be judged by other users and help determine who they match with
- The user is taken to the home page where they can swipe through a couple of users. They are expected to reject @ajjfish and accept @mwilson so that they will eventually be matched with user @mwilson.
- Tapping the message icon at the bottom (in the menu bar) takes them to their messages/matches. They may click on the conversation with @MWilson and send text, audio, video, etc. to begin the collaboration process.
- Tapping the gear takes them to the settings page, where they can log out (returns to the initial sign in page) or go to discovery settings.
- The discovery settings page allows the user to filter users they're shown by distance, gender, genre, and talent.

Prototype Notes

- Figma was used to make sketches
- InVision was used to put them together

Hard Coded Features

- We added video representations, because users need performances to evaluate
- Profiles were created because the app is social and requires there to be other users in order for the features to work
- Messages are included to show users communicating and how they use the app to collaborate (i.e. send files)

Limitations

- Videos could not be added to prototype preview
- Camera/Camera roll can not actually open
- Sending messages is not possible
- Export and other features in Figma had inconsistencies including sizing of pages, typeface support, etc.
- The app has no way of keeping track of different things that you selected, so things get reset all the time
- There is only a small set of profiles
